

# PROTECT TOILET BUILDINGS AGAINST COASTAL CORROSION

## COMPLETE Corrosion Resistance

For long-term protection against corrosive elements across Australia's coastal environments, consider a Modus Toilet Building built to our specialised coastal specification.

### Integrated finishing processes for superior protection.

- Treatments include: Pre-treatment, undercoat, topcoat and quality assurance inspection report.
- Hot dip galvanised steel is sand blasted and pre-treated before application of the undercoat.
- Intergard® 251 undercoat 2 pack epoxy anti-corrosive primer is a 75um coating pigmented with zinc phosphate for corrosion resistance.
- Topcoat of Interthane® 990 is 2 pack acrylic polyurethane gloss finish which can match any colour from the Colorbond® range.
- The final step is an inspection and quality assurance report, ensuring a finish is confidently delivered to the highest standard.

### EXTEND THE LIFECYCLE OF A MODUS TOILET BUILDING

It is important to adequately protect building materials exposed to corrosion in coastal environments. Here at Modus Australia we understand the complexities associated with coastal corrosion and have developed suitable finishes to protect all materials used in the construction of our toilet buildings. When considering a toilet building within 5km of the coastline it is essential to consider prolonging the lifecycle of the building with a selection of finishes specifically developed to protect against corrosive coastal elements.

### FABRICATED FOR THE FUTURE

After welding and fabrication, all structural steelwork is hot dip galvanised compliant with Australian Standards (AS/NZS 4680:2006). Hot Dip Galvanising coats and encapsulates all metal surfaces creating a durable, long-term protection from corrosion.

### LONG-TERM COASTAL CORROSIVE PROTECTION IS NOW EASIER TO SPECIFY

At Modus Australia we understand the importance of protecting our toilet buildings against coastal corrosion. Our aim throughout the careful selection of corrosion resistant finishes and materials was to unravel the complexity of the problem in a streamlined upgraded specification process. We add value by providing long-term corrosion protection for your infrastructure.
